## **ABSTRACT**

The invention relates to a laminated glass system [[(10)]] with two glass panel elements that are interlinked two-dimensionally by an adhesive synthetic material. A reinforcing element [[(15)]] is embedded in the intermediate layer [[(14)]] of the adhesive synthetic material. Said reinforcing element [[(15)]] extends through the laminated glass system [[(10)]] and is mechanically coupled at the outer edge with a support structure for the laminated glass system [[(10)]], thereby allowing an improved residual carrying capacity of such laminated glass systems also under unfavorable conditions and preventing the glass from completely breaking and thus detaching itself from the support structure.
